

## Small group discussion

### Learning outcome:

**LO4:** Articulate how computers and people can be combined to foster collective intelligence.

**Title:** In pursuit of collective intelligence

### Content for initial post:

After you have viewed Professor Malone's videos and explored the resources included in this unit, you should have a better sense of how humans and machines can be combined to work together in smarter ways. For most organizations, there is a lot of untapped potential, and many organizations are not as collectively intelligent as they could be. In this discussion, you have the opportunity to relate this to your organizational context. Share your thoughts on the following questions with your fellow participants:

- Does your organization operate intelligently?
- How do managers in your organization connect and combine people with machines to augment collective intelligence?
- What do you imagine the role of AI should be?

### Reminder:

Your discussions present an opportunity for collaborative, exploratory learning. It is recommended that you keep your discussion posts short and succinct (**no more than 200 words**) to encourage fluid discussions.

Over the coming weeks, you may connect strongly with the views and ideas shared by some of your fellow participants in the discussions. You can reach out to participants with whom you would like to continue your discussion by using the meetup forum in "Announcements and resources" on the Online Learning Campus.
